- 1. Electromechanical valve actuator for internal combustion engines, equipped with a polarized electromagnet (700) and with a mobile magnetic plate (706) switching between a first position close to the electromagnet (700) and a second position remote from the electromagnet (700), the switching times between these positions being determined depending on the operating state of the engine, characterized in that it comprises said means (704, 708) for supplying the electromagnet (700) with a variable attracting current in the course of the approach of the plate (706) to the electromagnet (700).
- 2. Actuator in accordance with claim 1, characterized in that it comprises means for reducing the attracting current as the plate (706) is approaching.
- 3. Actuator in accordance with claim 1 or 2, characterized in that it comprises means for inverting the direction of the current (i_b, i_h) supplying the electromagnet (700) when the plate (706) switches to the second position.
 - 4. Actuator in accordance with claim 3, characterized in that it comprises means for controlling a current (i_b, i_h) generating a magnetic field of an intensity lower than or equal to the intensity of the magnetic field generated by a magnet (704) of the electromagnet when the current is inverted.
 - 5. Actuator in accordance with one of the above claims, characterized in that the plate (706) moves into the vicinity of a second electromagnet in its second position and it comprises means for simultaneously controlling the current supplies for each electromagnet.
- 6. Actuator in accordance with one of the above claims, characterized in that it comprises a electromagnet (700) equipped with an E-shaped support, a magnet (704) being located at the end of one of the branches of the support opposite in relation to the plate (706).
 - 7. Actuator in accordance with one of the above claims, characterized in that

- the variations in the current are related to an amplitude and/or to a duration of supply.
- 8. Actuator in accordance with one of the above claims, characterized in that it comprises means for considering the speed of the engine to be a parameter of the
- 3 operating state of the engine.
- 9. Internal combustion engine equipped with an actuator comprising a
- 2 polarized electromagnet and a magnetic plate switching between a first position close to
- 3 the electromagnet and a second position, characterized in that the actuator is according to
- 4 one of the claims 1 through 9.
